Components with LIGNO® Rippe-x

Introduction

In the latest generation of Lignotrend structural ceiling elements too, a static load-bearing effect is combined with a high-quality, factory-finished visible surface in real wood, optionally with acoustic profile.

Element and visible surface are even more dimensionally stable: a **second transverse layer in the lower chord** and the so-called cross-laminated timber layer in the upper chord make the element even more tolerant to structurally related timber humidity changes. With **acoustic profiles the joint pattern is homogeneous like never** before: The showing-through of element joints under unfavourable conditions is now also consigned to the past.

As a cross-laminated timber web element, LIGNO Rippe-x utilises the timber efficiently without sacrificing the solidity. It is now fully **flexibly configurable for individual requirements** – be it as a ceiling for a detached house or as a highly sound-insulating ceiling for multi-storey buildings with fire resistance up to F90-B as well as with longitudinal and transverse channels for routing cables and pipes.

Noise protection

Due to their characteristics with regard to impact sound and airborne sound insulation, separating ceilings of almost any kind are possible, e.g. in multi-storey buildings, schools, offices, etc. Their use is also widespread in high-quality detached house construction, because they create a special quality of quietness due to sound insulation in the low frequency area. Disturbing, loud rumbling noises from the upper floor are minimised by following the **predefined, tested superstructures** ► [page 26](#)

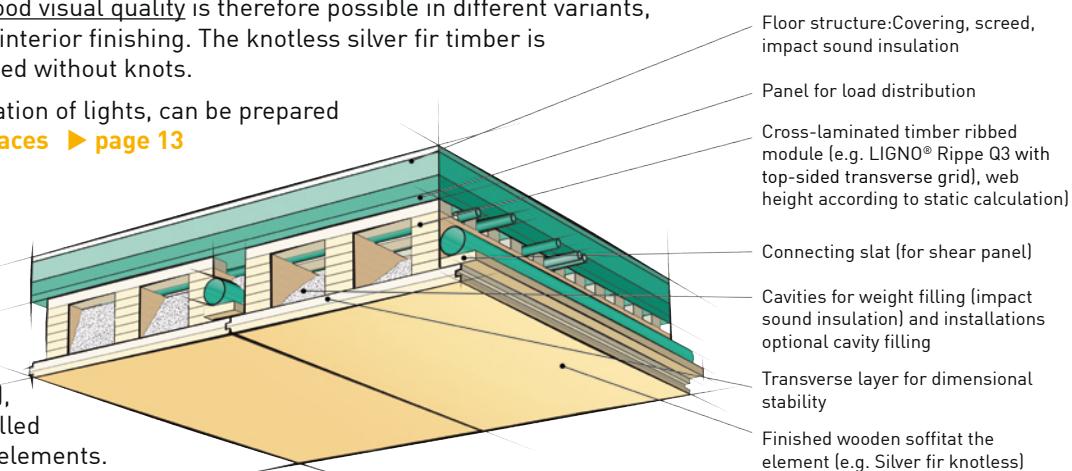

Visible surface

The noise protection described requires no cladding of the soffit. The production of the ceiling elements with real wood visual quality is therefore possible in different variants, which saves the subsequent interior finishing. The knotless silver fir timber is unique, because it is processed without knots.

Openings, e.g. for the installation of lights, can be prepared in the factory if desired. **Surfaces** ► [page 13](#)

Room acoustics

In case of requirements for a reduction of noise level and reverberation (e.g. in the construction of schools or offices, but also in modern living spaces), an acoustic absorber is installed during the production of the elements. The visible layer is profiled accordingly with slats. **Acoustic profiles** ► [from page 12](#)

Span widths

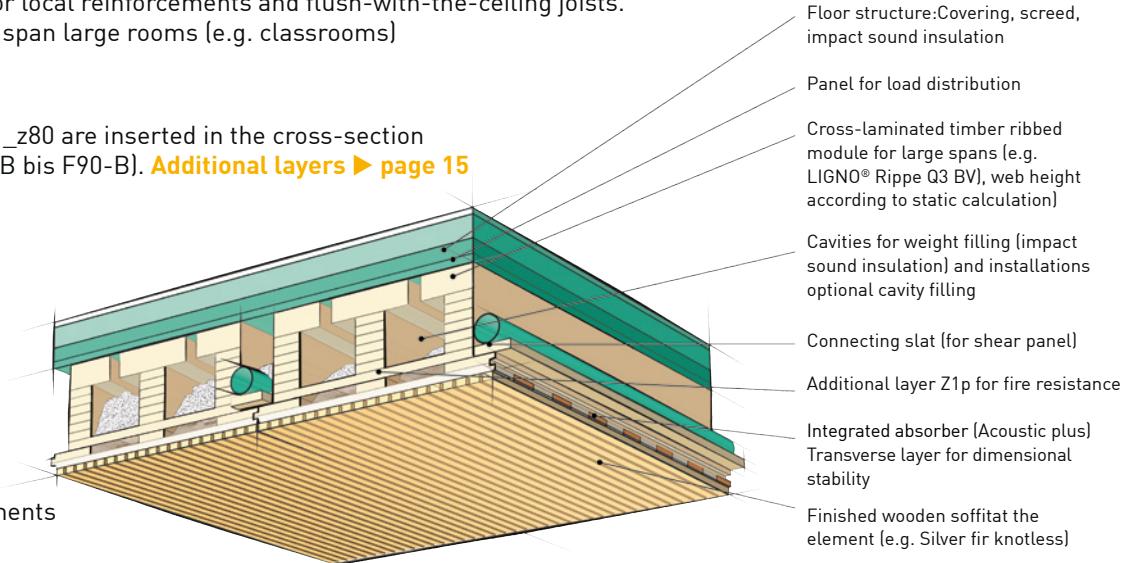

Freedom of design in the floor plan is made possible by free span widths. Elements can be prepared in the factory for local reinforcements and flush-with-the-ceiling joists. BV elements are used to span large rooms (e.g. classrooms)

Fire resistance

Additional layers _z26 to _z80 are inserted in the cross-section for fire resistances (F30-B bis F90-B). **Additional layers** ► [page 15](#)

Construction biology

The harmlessness to health of the bonding is certified by the natureplus® certificate no. 0211-0606-014-1, which is based on stringent tests. The soft wood fibre material installed in acoustic elements is likewise certified.

Configuration procedure

LIGNO® Rippe Q3-x

Phase 1

Based on your requirements, preselect the component features:

Sound and thermal insulation

► from page 26

Selection of the component structure: Tested superstructures, e.g. for increased noise protection, including low frequency, and for thermal insulation if applicable.

Implementation as a web or box element

► page 8

Selection of the top side:
for the top-side installation layout, longitudinal
and/or transverse on the ceiling, or as a level surface for the roof superstructure.

Statics

► page 9

Definition of the approximate bar height (pre-dimensioning with Lignotrend LTB-x dimensioning program and DC Statik): From normal to large span widths, with vibration verification.

Fire resistance

► page 10

Arrangement of the so-called additional layer for fire protection F0-B to F90-B, bulkhead solutions for cable/pipe feed-throughs.

Installation space / additional absorber

► page 10

If necessary: selection of the so-called plus layer.
Additional channels for cables/pipes/built-in components underneath the fire-protection layer.

Surface and room acoustics

► from page 11

Definition of the component soffit: Various types of timber including knotless, closed surfaces, acoustic slats/board profiles, integrated acoustic absorbers.

Phase 2

To determine the cross-sectional height, static dimensioning is carried out with the LTB dimensioning program and DC-Statik ► [page 9](#).

Your Lignotrend consultant will be glad to do that for you.

Element height (direct load-capacity verification)

With the free **LTB-x dimensioning software and DC-Statik**, a configuration can be created with realistic pre-dimensioning and a verifiable proof. Download from ► www.lignotrend.com/downloads

For the LTB-x, the so called „**hot dimensioning**“ (fire resistances F30-B, F60-B und F90-B) a second, **separate verification** is to be carried out in which the theoretical residual cross-section is to be taken into account.

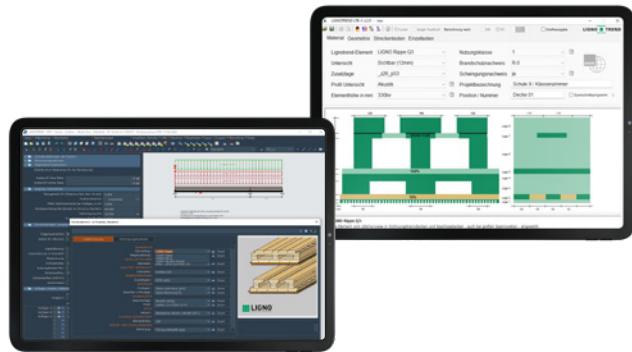

Plate load capacity

The **statically effective plate** is formed by coupling the element strips with butt boards. **Multi-ply butt boards** (cross- section 95 mm x 26,5 mm) are delivered as standard. These are fastened on site, for example with clamps. Additional stiffening boards or diagonals are not usually necessary!

A static verification of the plate is necessary.

► Characteristic values from page 33

Configuration of the fire resistance

Configuration of the lower installation area

Additional layers for fire resistance

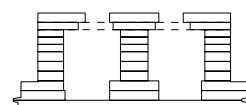

For a calculable behaviour in case of fire, closed timber layers of different thicknesses are located above the soffit. They isolate at Rippe Q3 the upper area from the soffit with acoustic absorber respectively at RippeQ2i from the lower installation area.

Plus layers for lower installation area

The lowering of the soffit using so-called plus layers enables the flexible layout of cables/pipes without having to penetrate the fire protection level. They increase the sound absorption capacity and allow the installation of spots. With Rippe Q2i, a large area is created for transverse and longitudinal cable routing.

NSi

Sharp-edged 4 mm joint at lateral element butt joint

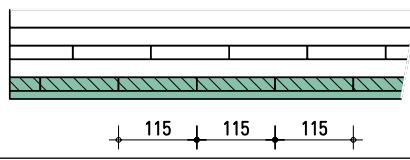

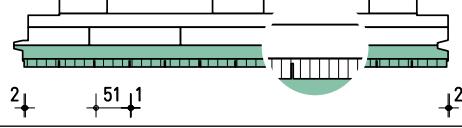

625-51-1

all types of wood

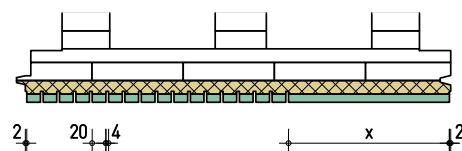

51 mm strips, 1 mm joint in the surface, sharp-edged 4 mm joint at lateral element butt joint

Special versions (on request)

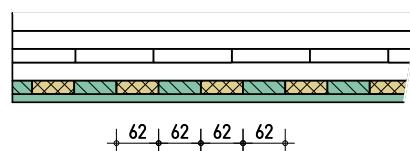

Profiling of partial surfaces

Only a part of the soffit is scored.

Transverse layer _a50g or _a0

Transverse layer with or without absorber

Acoustic perforation

Drilling the soffit,
provided this is technically feasible.

Transverse layer _a50g or _a0

Transverse layer with or without absorber

Configuration of the element soffit

Type of timber, surface treatment

High-quality real wood soffit

With most types of timber, the single-layer boards used for the visible layer of the elements consist of lamella sections, which are connected lengthwise by vertical or horizontal finger-joints. Approx. every 2.87 m, the elements are coupled by a general butt joint, which is recognisable close up as a fine line over the 625 mm element width.

- The technical data sheet “LIGNO® surfaces” contains a precise description of the timber character

Silver fir knotless, patterned	<u>_WTL</u>	Vivid pattern, variation in brightness and colour
Silver fir knotless, patterned, impregnated	<u>_WTL-i</u>	Like WTL, but impregnated for flame retardancy. <u>Only in conjunction with acoustic profile</u> . Required on the load-bearing element only in special cases.
Silver fir knotless, plain	<u>_WTS</u>	Like WTL, but with less variation, finer grain. <u>Availability limited, please enquire about delivery time</u> .
Silver fir knotless, economy	<u>_WTE</u>	Like WTL, but with wood irregularities. <u>Only in connection with the profile 625-51-1 and with acoustic profiles</u> .
Spruce knotless, plain	<u>_FIS</u>	Comparable with WTS, but very little colour variation
Spruce knotless, plain, impregnated	<u>_FIS-i</u>	Like FIS, but impregnated for flame retardancy. <u>Only in conjunction with acoustic profile</u> . Required on the load-bearing element only in special cases.
Spruce knotty (A qual.)	<u>_Fl-ä</u>	Grade with knots, homogeneous pattern, continuous lamellae without finger-joints. <u>Note: Knots may be conspicuous with narrow slat profiles</u> .
Knotless oak	<u>_EI</u>	Vivid pattern, variation in the brightness, lamella joint visible only as a line (horizontal finger joints). <u>Availability/stock limited, please enquire about delivery time</u> .
Larch	<u>_LÄS</u> <u>_LÄE</u>	LÄS has a vivid pattern with slight variations in brightness, LÄE on the other hand has a calmer appearance
Other types of timber		Should the element soffit be designed with a different type of timber? Contact the Lignotrend consultant; he will check the feasibility.

Inexpensive soffit without visible quality requirement

If the ceiling soffit is to be clad on site with plasterboard or implemented with a suspended ceiling, wood in a non-visible quality is used for the lowest layer.

Industrial quality	<u>_NSI</u>	Single boards laid with joints or single-layer plates that are unsuitable for visible qualities. Different types of timber can be mixed in elements or pickings.
---------------------------	-------------	--

Surface treatment

Light-protection primer, colourless	Glaze for light-coloured woods: Colourless UV-protection primer to prevent darkening of the wood. Suitable for interior use (not classified as toxic). Final treatment necessary if washout cannot be ruled out. Make: Adler Lignovit Interior UV 100 LT5.
Other surface treatments	An on-site application is recommended for other final treatments of the surface.

Sound insulation Requirements

Normative requirements and recommendation

Component	Noise protection level			
	1 Base \triangleq DIN 4109-1:2018	2 Base +	3 Comfort	4
1 Apartment isolating wall	$R'_{w} \geq 53 \text{ dB}$	$R'_{w} \geq 56 \text{ dB}$	$R'_{w} \geq 59 \text{ dB}$	
2 Row house isolating wall	$R'_{w} \geq 62 \text{ dB}$	$R'_{w} \geq 62 \text{ dB}$ $R_w + C_{50-5000} \geq 62 \text{ dB}$ ¹⁵	$R'_{w} \geq 67 \text{ dB}$ $R_w + C_{50-5000} \geq 65 \text{ dB}$ ¹⁵	
3 Apartment isolating ceiling	$R'_{w} \geq 54 \text{ dB}$	$R'_{w} \geq 57 \text{ dB}$	$R'_{w} \geq 60 \text{ dB}$	
4 Apartment isolating ceiling impact sound level	$L'_{n,w} \leq 53 \text{ dB}$ ³	$L'_{n,w} \leq 50 \text{ dB}$ $L_{n,w} + C_{I,50-2500} \leq 50 \text{ dB}$ ²	$L'_{n,w} \leq 46 \text{ dB}$ $L_{n,w} + C_{I,50-2500} \leq 47 \text{ dB}$ ²	
5 Roof terraces and loggias with living spaces underneath	$L'_{n,w} \leq 50 \text{ dB}$	$L'_{n,w} \leq 50 \text{ dB}$	$L'_{n,w} \leq 46 \text{ dB}$	
6 Ceilings under arcades (in all sound propagation directions)	$L'_{n,w} \leq 53 \text{ dB}$	$L'_{n,w} \leq 50 \text{ dB}$	$L'_{n,w} \leq 46 \text{ dB}$	
7 Staircase and stair landing	$L'_{n,w} \leq 53 \text{ dB}$	$L'_{n,w} \leq 50 \text{ dB}$	$L'_{n,w} \leq 46 \text{ dB}$	
8 Exterior noise according to noise level range and requirements of DIN 4109				Requirement according to DIN 4109 incl. consideration $C_{tr,50-5000}$ for the opaque component ⁴
9 Further components	according to DIN 4109-1:2018	according to DIN 4109-1:2018	according to DIN 4109-5:2019 ⁶	

Source: Schallschutz im Holzbau - Grundlagen und Vorbemessung; Holzbau Handbuch | Reihe 3 | Teil 3 | Folge 1; Seite 13

1 Supplementary airborne sound requirement value only for the component without flanks

2 Supplementary impact sound requirement value only on the component without flanks

3 Special regulation for ceiling constructions to be assigned to DIN 4109-33:2016 otherwise $L'_{n,w} \leq 50 \text{ dB}$

4 Separate consideration for window area parts over 30 %, pure component requirement

5 Requirement for the double-skin wall, both walls

6 According to the respective valid version or E-DIN 4109-5:2018

Characteristic values with regard to building physics (heat/humidity)

The usage case of the (upwardly open) LIGNO® Rippe cross-laminated timber web element as an exterior component is comparatively rare and usually only occurs in the case of ceilings that run from the interior to the areas of loggias or roof patios.

In this case the Lignotrend consultants and the engineers from the Lignotrend internal Technical Service can also provide **thermal conductivities** and **vapour diffusion resistance figures** for ceiling elements as well as support with the detailed planning where necessary.

Noise protection characteristic values

Structural ceilings

Impact sound and airborne sound with structural ceilings

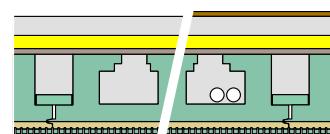

Ceiling components made of LIGNO® achieve very good values for the standard impact sound level $L_{n,w}$ and for the sound insulation value R_w , even without cladding on the underside. If implemented appropriately, separating ceilings with increased noise protection can also be realised. Only those products that are equivalent in terms of the noise-relevant characteristic values to the products specified in the test reports (e.g. density, dynamic stiffness) may be used in the structure!

Specified values are laboratory values; **a reserve is therefore to be taken into account in the verification for the secondary sound paths!** The following must be adhered to:

existing $R'_w \geq$ required R'_w as well as existing $L'_{n,w} \leq$ required $L'_{n,w}$.

Secondary sound paths

The extent of the secondary sound paths depends on the implementation of the ceiling itself at the respective node as well as the structure and sound insulation of the adjoining wall components.

The complete interruption of the beam at delicate detail points is usually most favourable. If that is not possible, a more favourable characteristic value can be achieved by use of the gravel filling and/or suitable isolation of the compartments.

On request we will provide a **combination matrix for the respectively relevant flank transmission assessment variable $D_{n,f,w}$** for the verification of many combinations of LIGNO® Rippe/Decke and cross-laminated timber walls in different thicknesses as well as timber frame walls.

The engineers from our internal Technical Service will advise you on the carrying out of the verification or implementation.

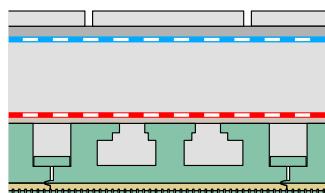

Taking into account walking noises

Consideration of low sound frequencies is recommended for a good sound insulation quality of timber ceilings in order to be able to estimate how well the transmission of muffled, rumbling walking noises is prevented. Although there is no requirement (yet) in the standards, the sum of impact sound level and spectrum adaptation value $L_{n,w} + C_{1,50-2500}$ can be taken as a comparison value for two component superstructures.

Characteristic values

Acoustic absorption

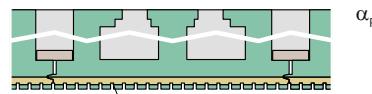

Key absorption figures

Subsequent interior finishing work for room acoustics absorbing suspended ceilings is rendered superfluous if the element is configured with an acoustic slat profile, see ► [page 11](#). Natural soft wood fibre material is used as the absorber material. To improve the low-frequency properties, optional cavity insulation is inserted in the plus layer if necessary. LIGNO® Rippe Q2i
+i120/+i160/+i200

Acoustic absorption varies with the height of the cavity underneath. For details see:

► [Technical data LIGNO® Acoustic light](#)

Online room acoustics calculation for investigating the room acoustics properties of rooms

► www.lignotrend.com/acoustic-calculator

Note: This calculation software merely determines the absorber area required for the described cubature and does not make any statement regarding the location of the absorber areas in the room. The results should therefore be regarded as an orientation and are not a substitute for an expert in room acoustics (e.g. specialist engineer).

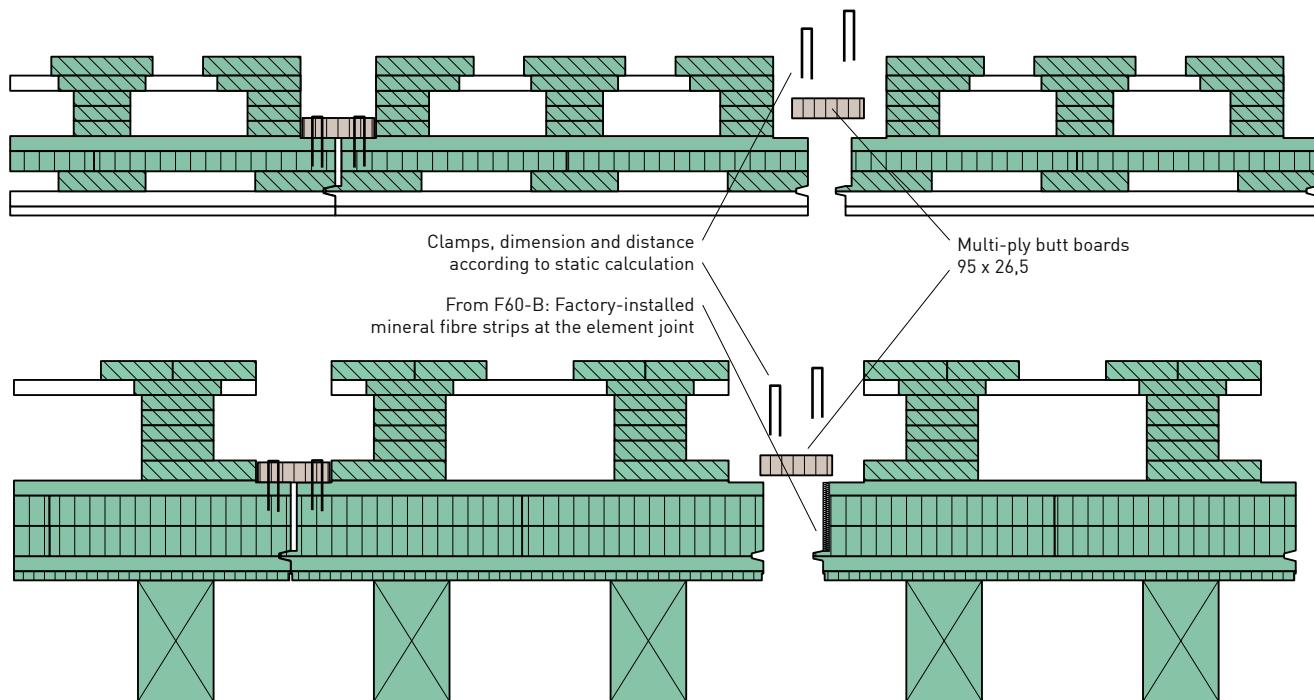

Formation of statically effective plates

Coupling

Coupling is done by means of a butt board at the **lateral butt joint of the element strips**. Multi-ply butt boards (cross-section 95 mm x 26,5 mm) are delivered as standard. Additional stiffening boards or diagonals are not usually necessary.

The butt boards are connected to both adjacent elements with **brackets**, wood screws are used less often (dimension and distance of the connecting means as specified in the static calculation).

The **connection of the plate to the adjacent components** is usually done with **long wood screws (d= 8 mm)**, which are mounted through the bars

**The butt boards are used as boards for the transport pallets when delivering.
Use the dismantled pallets for the element joint!**

Static verification

In particular, the following points must be taken into account when verifying ceiling plates:

- Load-bearing capacity of the elements as well as of butt board and connection means
- Plate edge belt
- Connection joints to neighbouring components
- Resilience of the connection means/plate deformation

Software for static calculation for roof and ceiling plates ► www.lignotrend.com/downloads.

The Technical Dept. is available for support with the verification.

Load capacity values

Butt board C24 (95 mm x 26,5 mm)	acceptable shear flow	R _k	53	kN/m					
Clamps	Distance	e	3	5	7,5	10	15	100	cm
1,80 x 50	acceptable shear flow	R _k	20,63	12,38	8,25	6,19	4,13	0,62	kN/m
1,53 x 50	acceptable shear flow	R _k	15,80	9,48	6,32	4,74	3,16	0,47	kN/m
Wood screws	Distance	e	10	20	30	50	100	200	cm
d= 6 mm	acceptable shear flow	R _k	12,6	6,30	4,20	2,52	1,26	0,63	kN/m
d= 8 mm	acceptable shear flow	R _k	22,2	11,1	7,39	4,44	2,22	1,11	kN/m

Plate characteristic values

LIGNO® Rippe Q3

Load capacity and rigidity values

The characteristic values from the following tables are entered in the plate verification. Since, as a rule, depending on the load case transverse to or parallel with the element strips, either the complete number of whole elements or exactly one edge element are applied for the load dissipation, the **values for the shear load capacity of the elements per element in the laying width of 0.625 m are specified**, not on the 1 m-wide plate surface.

Fire protection socket box F-Tronic (e.g. LIGNO® Rippe Q3_z53_p0)

Fire resistance F60-B

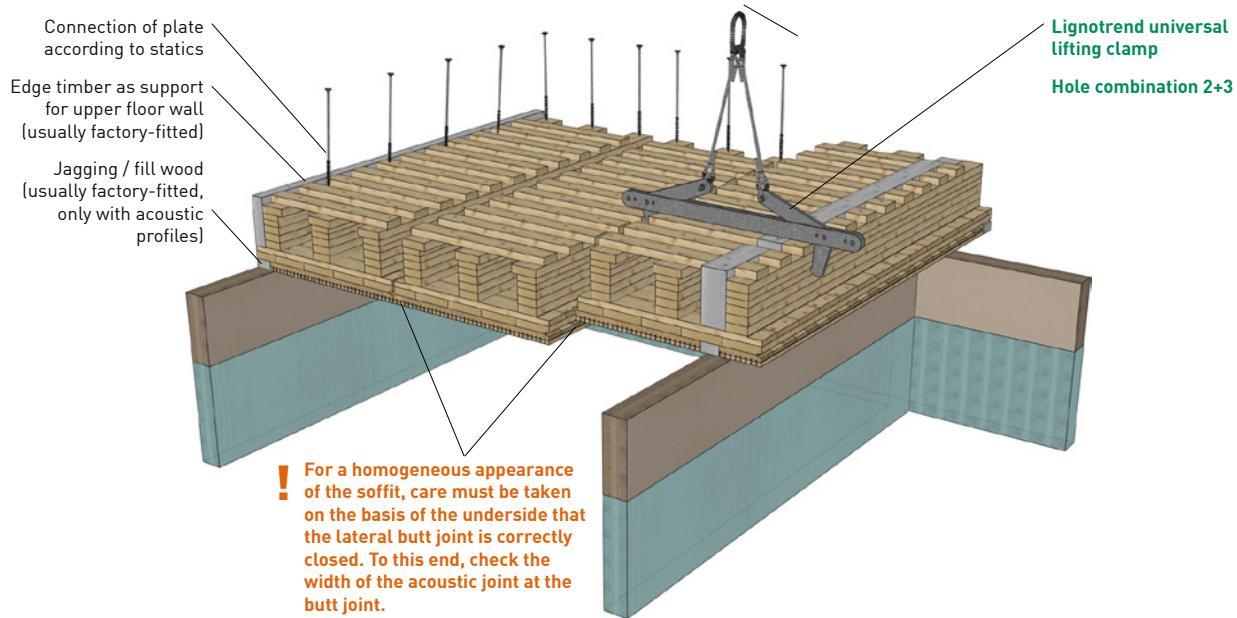

Assembly procedure general

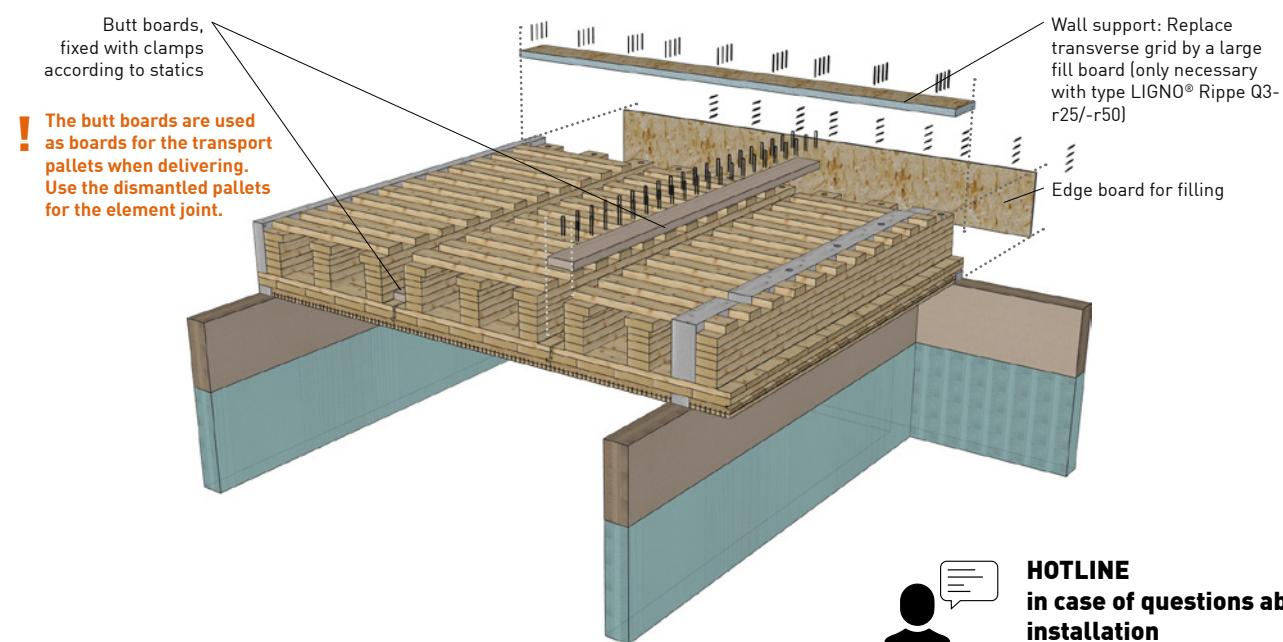

Step 1: Laying

The ceiling elements are laid strip-wise and pulled together laterally – if necessary, a rafter or a clamp can be used as an aid. After aligning the elements, each element is fixed to the walls.

Step 2: Plate formation

After checking the soffit, the butt boards can be inserted and fixed (see ► page 33). If not factory-fitted, edge boards are attached to prevent the filling from flowing out later. The following storey can be erected.

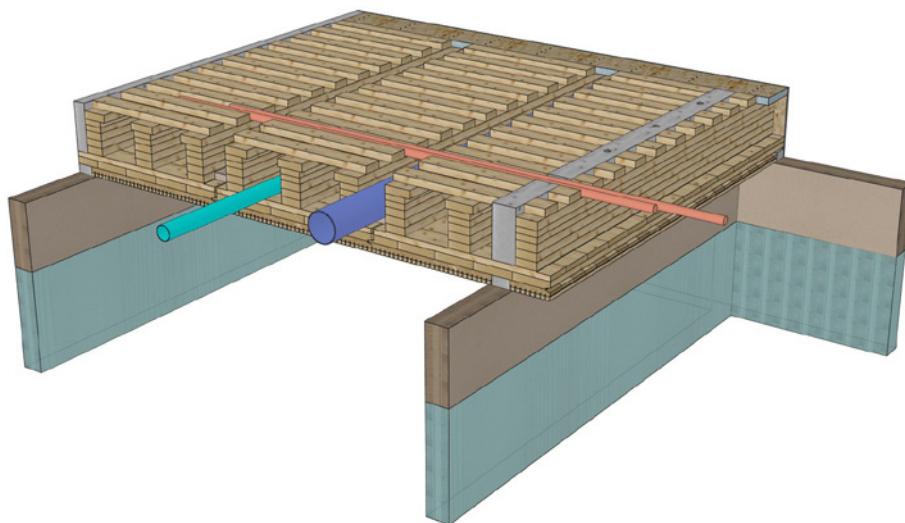

HOTLINE
in case of questions about
installation
+49 7755 9200-70

Step 3: Installation of cables/pipes (after completion of the building shell)

The cables/pipes are installed in the longitudinal and transverse channels.

For available installation area, see ► [page 41](#).

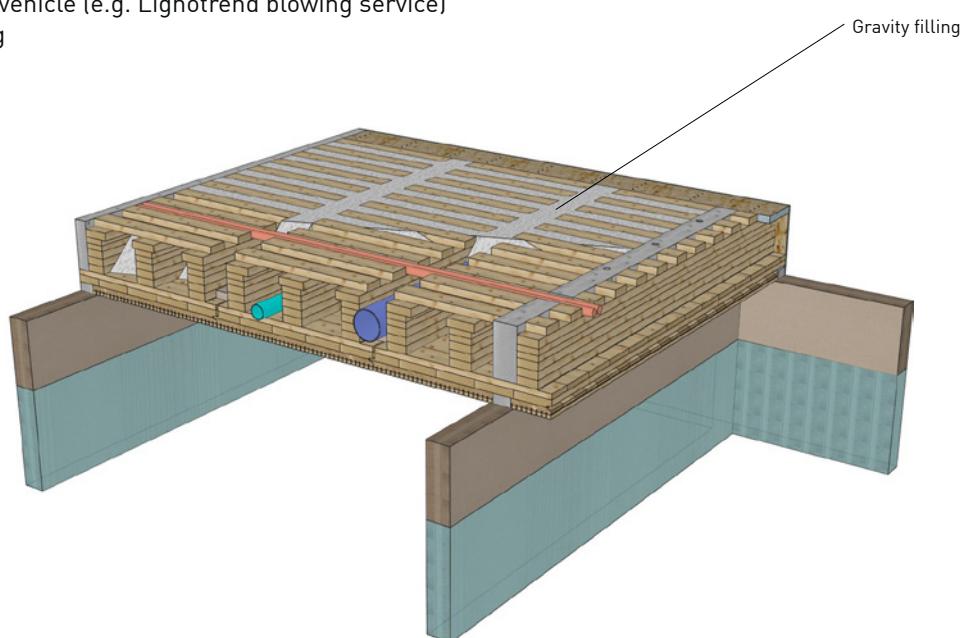

Step 4: Gravel filling and ceiling construction

After installing the cables/pipes, the cavities are filled and the floor structure is installed with impact sound insulation and covering. Please note the material specifications for tested noise protection characteristic values, see

► [page 25](#).

Installation procedure for limestone gravel:

- Blowing in from silo vehicle (e.g. Lignotrend blowing service)
- Pouring from big bag
- Bagged goods

Assembly procedure

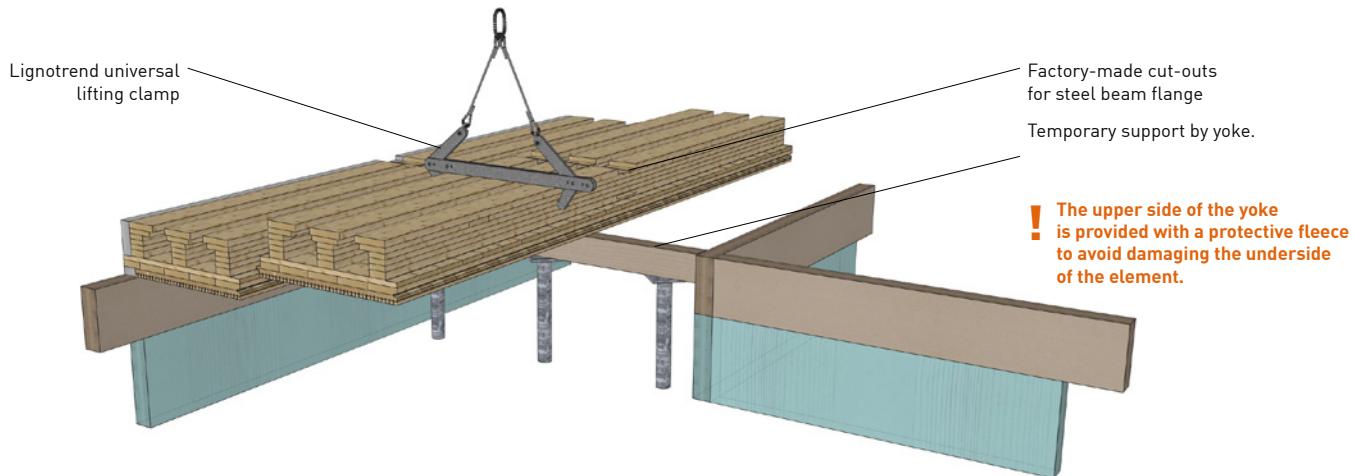

Flush-with-the-ceiling steel girders

Step 1: Yoke preparation and installation

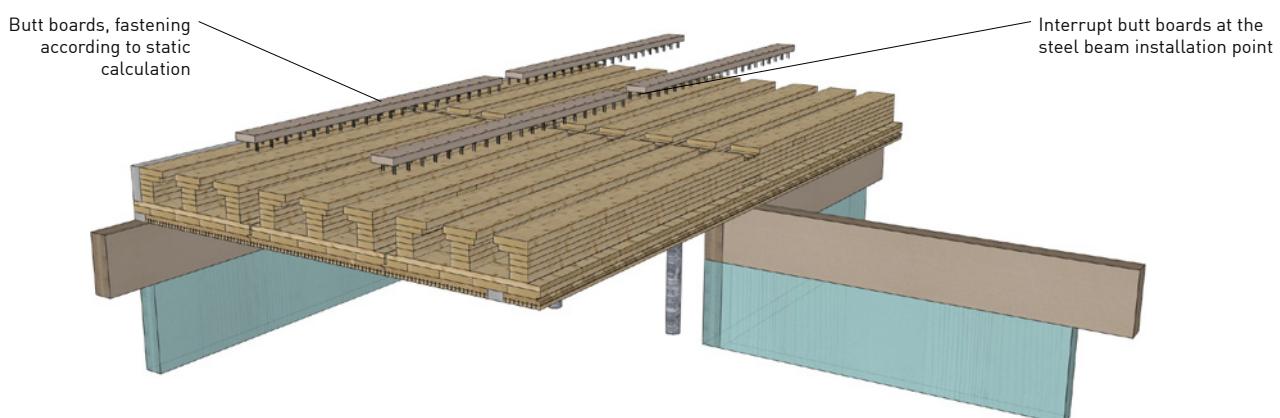

A yoke is erected and levelled at the hypothetical support height in the axis of the steel beam that is to be installed later. Subsequently, the ceiling elements can be installed following the normal procedure.

For construction details, see ▶ [page 38](#).

Step 2: Fixing the ceiling

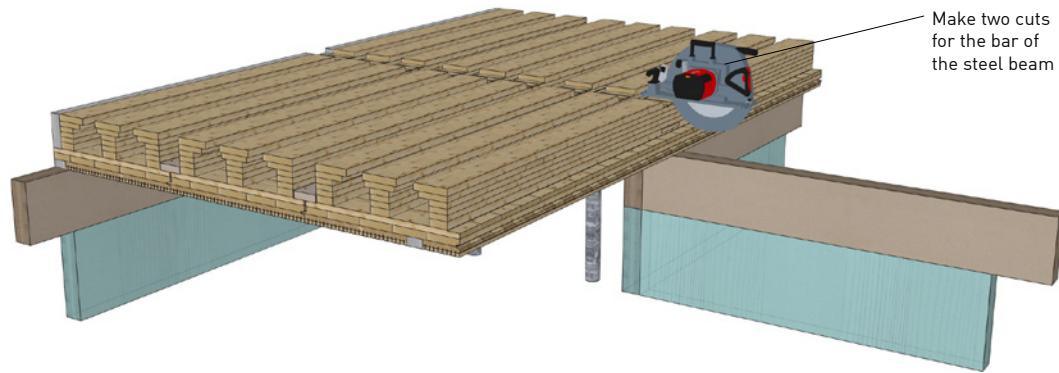

The ceiling plate is fixed to the wall construction, butt boards installed.

HOTLINE
in case of questions about
installation
+49 7755 9200-70

Step 3: Cut for steel bar

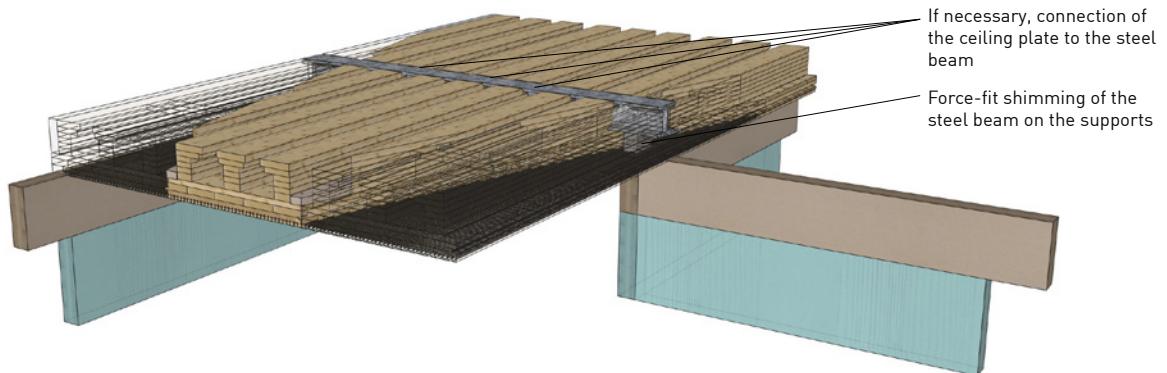

For the installation of the steel profile, the ceiling elements in the beam axis are separated on site.

Step 4: Support of steel beam, removal of yoke

The steel beam is shimmed with a force fit at its support points. If statically foreseen, the ceiling plate is connected via the steel beam.

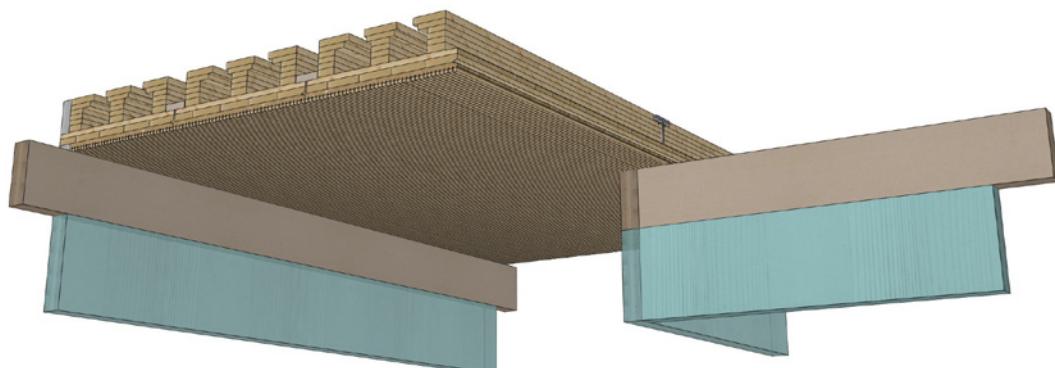

The yoke can be removed.

Step 5: Result: Continuous soffit

Without changing the laying direction, a continuous soffit is created.

The steel beam is located, protected against fire, behind the fire protection layer; coating is not necessary.

Processing instructions

Incoming goods / unloading

- Unload the elements one by one
- Never transport loads above people.

Unloading with fork-lift truck:

- Use a fork-lift truck only if the elements are on pallets or have no visible surface.
- Recommended for short elements up to a length of 6 metres (risk of sagging). Use a crane to unload longer elements.
- Unload only on a level surface.
- Set the forks as far apart as possible.
- Make sure the fork-lift truck has a sufficient load capacity and that its forks are long enough.

Unloading with a crane:

- Ensure stability and a sufficient load capacity.
- Use only intact attachment and load lifting devices.
- Observe the maximum working load limit of all individual components.
- Never stretch textile attachment devices over sharp edges; use edge protectors if necessary.
- Do not stretch chain slings or wire ropes over the visible surface.

If using Würth transport anchors:

- Always attach transport anchor bolts vertically, without diagonal pull.
(Risk of overloading the transport anchor bolts or pulling them out)
- Always attach all factory-fitted transport anchor bolts for lifting and transporting.
- Use a cross beam with load compensation if there are more than two transport anchor bolts per element side.

If using textile attachment devices (e.g. lifting straps, round slings):

- Suitable only for single elements!
- Attach to the element in at least two places.
When doing this, keep at least 1 metre from the abutting edge and the centre of gravity.
- If necessary, lay a board under the element over its entire width so that the attachment device is not pulled directly over the outer edge of the visible surface.

If using LIGNO® lifting clamps:

- Suitable only for single elements!
- Adjust the lifting clamps to the individual element width.
- Attach two lifting clamps to the element.
- Always attach lifting clamps vertically, no diagonal pull. (Risk of the handle being unhooked or torn out)

Intermediate storage

- Store protected against splash water and level on suitable support wedges
- Protect against moisture and long-term solar irradiation
- No long-term outdoor storage!
(also not under foil, otherwise danger of formation of dew and mould!)

Assembly

- To protect the visible surface, use only the illustrated or equivalent lifting tools
- For protection against dirt, wear clean gloves when assembling

Weather protection

- **Keep a large tarpaulin at the ready (for use in case of thunderstorms, for example)**
- **Apply the first sealing layer (e.g. weatherproof vapour barrier) as soon as possible after assembly.**

Coupling to the plate

- Fastening with clamps according to statics, see also ► **page 24**. Plate connection to wall construction with screws according to statics.
- The butt boards are used as boards for the packaging pallets when delivering.
Use the dismantled pallets for the element joint.

Important note:

- **When installing elements with acoustic profile, attention must be paid to the width of the acoustic joint in the butt joint.**
- **Before fixing each element: check the butt joint from the underside of the ceiling!**

In addition, the general application notes on Lignotrend cross-laminated timber products are to be observed.
